                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a heavy chain hypervariable region of the murine anti-vascular endothelial growth factor (anti-VEGP) antibody. The sequence is used to construct the humanised anti-VEGP antibody of the invention. The humanised antibodies are used to inhibit VEGP-induced angiogenesis, particularly for treating or preventing tumours (of any type) and retinal disorders (e.g. age-related macular degeneration or diabetic retinopathy). They can also be used to treat other conditions that involve anglogenesis, e.g. rheumatoid arthritis, psoriasis, atherosclerosis, Grave's disease, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New humanised antibody with affinity for vascular endothelial growth factor - for treatment of tumours, retinal disease and other angiogenic states, also related nucleic acid, vectors and transformed cells.
                                                                                                                                                                                                                                                                                                                                                                                                                  Heavy chain hypervariable region; murine; humanised antibody; anti-vascular endothelial growth factor antibody; anti-VEGF antibody; VEGF-Induced angiogenesis; tumour; retinal disorder; agge-related macular degeneration; diabetic retinopathy; rheumatoid arthritis; psoriasis; atherosclerosis; Grave's disease.

The present invention relates to humanised anti-VEGF (vascular endothelial growth factor) antibodies or a variant of a parent anti-VEGF antibody, which binds human VEGF. The anti-VEGF antibodies are useful for inhibiting VEGF-induced angiogenesis in a mammal (particularly a human), particularly those having a tumour or a retinal disorder e.g. intraocular neovascular disorders. The present sequence is an exemplary heavy chain variable domain of the humanised anti-VEGF antibody of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antibody; antigen binding fragment; cell culture; variable domain; modified framework region; hypervariable region; cytostatic; antinflammatory; antiangiogenic; immunomodulatory; antibody therapy; tumour; inflammatory disorder; andiogenic disorder; immunological disorder; anti-VRGF antibody; anti vascular endothelial cell growth factor antibody; heavy chain; HVRI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New humanized anti-VEGF (vascular endothelial growth factor) antibodies or their variants, useful for inhibiting VEGF-induced angiogenesis in a mammal, particularly for treating tumor or retinal disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 10;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 62; DB 5; Length 10

```
method. The method comprises of a manibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the acid at each variable position with at least part of the remainded at the acid at each variable position with at least part of the remainder of the antibody, including the selected amino acid at other variable position with at least one optimized physico-chemical property. The method is useful for optimizing the physico-chemical property. The method is useful for optimizing the physico-chemical property. The method is useful for optimizing the physico-chemical property. The present sequence with at least one solubility, or antigen binding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody wariable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New humanised antibody with affinity for vascular endothelial growth factor - for treatment of tumours, retinal disease and other angiogenic states, also related nucleic acid, vectors and transformed cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a variable heavy domain of an affinity-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Anti-VEGF humanised antibody variable heavy domain of variant Y0313-1
                                                                                             The present invention relates to a method for optimizing at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Heavy variable domain; murine; humanised antibody;
anti-vascular endothelial growth factor antibody; anti-VEGF antibo
VEFF-induced anglogenesis; tumour; retinal disorder;
age-related macular degeneration; diabetic retinopathy;
rheumatoid arthritis; psoriasis; atherosclerosis; Grave's disease.
comprises analyzing the interactions of amino acids at variable positions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                  physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one enforced belonging to the antibody structure; selecting at least one enforced belonging to the antibody structure; selecting at least one enforced to be considered at the variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least one optimized physico-chemical property. The method is useful for optimizing the physico-chemical property of an antibody, especially the stability, solubility, or antigen binding affinity. The optimized may be useful for treating a patient. The present sequence is an antibody may be variable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                       present invention relates to a method for optimizing at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                        Computer optimization of physicochemical properties of antibodies comprises analyzing the interactions of amino acids at variable positions.

The present sequence represents a variable heavy domain of an affinity-matured anti-vascular endothelial growth factor (anti-VBGF) antibody variant. The sequence is used in the course of the invention to produce the humanised anti-VBGF antibody of the invention. The humanised anti-VBGF antibody of the invention. The humanised for treating or preventing tumours (of any type) and retinal disorders for treating or preventing tumours (of any type) and retinal disorders also be used to treat other conditions that involve anglogenesis, e.g.
                                                                                                                                                                                                                         ö
matured anti-vascular endothelial growth factor (anti-VEGF) antibody variant. The sequence is used in the course of the invention to produce the humanised anti-VEGF antibody of the invention. The humanised antibodies are used to inhibit VEGF-induced angiogenesis, particularly for treating or preventing tumours (of any type) and retinal disorders (e.g. age-related macular degeneration or diabetic retinopathy). They can also be used to treat other conditions that involve angiogenesis, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New humanised antibody with affinity for vascular endothelial growth factor - for treatment of tumours, retinal disease and other angiogenic states, also related nucleic acid, vectors and transformed cells.

The sequence is used in the course of the invention to produce the humanised anti-VEGF antibody of the invention. The humanised antibodies are used to inhibit VEGF-induced angiogenesis, particularly for treating or preventing tumours (of any type) and rethinal disorders (e.g. age-related macular degeneration or diabetic retinopathy). They can also be used to treat other conditions that involve angiogenesis, e.g. rheumatoid arthritis, psoriasis, atherosclerosis, Grave's disease, etc

Anti-VEGF antibody YO243-1 heavy chain variable domain.
The present sequence is the heavy chain variable domain of the F(ab)-12 antibody variant Y0238-3. F(ab)-12 is a humanised anti-vascular endothalial growth factor (VEGF) antibody. F(ab)-12 was the parent artibody used in the production of a large number of antibody variants containing randomised peptide inserts within the complementarity determining regions (CDRS). Phage display libraries were subjected to eight rounds of selection to isolate variants with an antigen binding affinity at least two-fold stronger than the binding affinity of parent antibody for the target VEGF antibody. The anti-VEGF antibody variants may be useful in diagnostic assays for detecting expression of VEGF in cells, tissue or serum. They may also be used in the prevention and treatment of neoplastic diseases such as breast cancer, lung cancer and arthritis, psoriaals, atherosclerosis, and diabetic and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present sequence is the heavy chain variable region of the affinity matured anti-vascular endothelial cell growth factor (anti-VEGF) antibody voca-1. Humanised Febb-12 and affinity matured anti-VEGF) antibodis may be used to treat conditions characterised by undestrable excessive neovascularisation. Such conditions include tumours (especially solid neovascularisation. Such conditions include tumours (especially solid other retinopathies, retrolental fibroplasia, age-related macular degeneration, neovascular glaucoma, haemangiomas, thyroid hyperplasias (including Grave's disease), corneal and other tissue transplantation, and chronic inflammation. Oedemas associated with malignancies, meig's syndrome, head trauma, and ascites associated with malignancies, meig's syndrome, lung inflammation, nephrotic syndrome, pericardial effusion and pleural effusion, may also be treated Monoclomal antibodies are generated in hybridoma cells and those with affinity for VEGF are identified by immunoprecipitation or by an in vitro binding assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating edema, tumors, rheumatoid arthritis, psoriasis, atherosclerosis, diabetes and chronic inflammation in a mammal, comprises administering a human vascular endothelial cell growth factor antagonist.
YO243-1; vascular endothelial cell growth factor; VEGF; antibody; antiinflammatory; cerebroprotective; cytostatic; antirheumatic; antiarthritic; antipsoriatic; antiarteriosclerotic; antidiabetic; antithyroid; excessive neovascularisation; tumour; rheumatoid arthritis; psoriasis; atherosclerosis; diabetes; retrolental fibroplasia; neovascular glaucoma; haemangloma; thyroid hyperplasia; Grave's disease; tissue transplantation; inflammation; oedema; trauma;

The present sequence is the heavy chain variable region of the affinity matured anti-vascular endothelial cell growth factor (anti-VEGF) antibody (YO17). Humanise Febb-12 and affinity matured anti-VEGF antibodies may be used to treat conditions characterised by undesirable excessive neovascularisation. Such conditions include tumours (especially solid comes), rheumatoid arthritis, psoriasis, atherosoflerosis, diabetes and coher retinopathies, retrolental fibroplasia, age-related macular degeneration, neovascular glaucoma, haemangiomas, thyroid hyperplasias (including Grave's disease), corneal and other tissue transplantation, and chronic inflammation. Ocdemas associated with tumours, strokes and head trauma, and ascites associated with malignancies, meig's syndrome, lung inflammation, nephroite syndrome, pericadial effusion and pleural effusion and pleural effusion and pleural hybridoma cells and those with affinity for VEGF are identified by immunoprecipitation or by an in vitro binding assay

Treating edema, tumors, rheumatoid arthritis, psoriasis, atherosclerosis, diabetes and chronic inflammation in a mammal, comprises administering a human vascular endothelial cell growth factor antagonist.

Disclosure, Fig 14B; 60pp; English.

The present sequence is the heavy chain variable region of the affinity matured anti-vascular endothelial cell growth factor (anti-VEGF) antibody constructed anti-vascular endothelial cell growth factor (anti-VEGF) antibody voli3-1. Humanised F(ab)-12 and affinity matured anti-VEGF antibodies may be used to treat conditions characterised by undesirable excessive neovascularisation. Such conditions include tumours (especially solid ones), rheumatoid arthitis, psoriasis, atherosclerosis, diabetes and other retinopathies, retrolental fibroplasia, age-related macular degeneration, neovascular glaucoma, hasmangionas, thyroid hyperplasias of including Grave's disease), corneal and other tissue transplantation, and chronic inflammation. Ocembal and other tissue transplantation, and ascites associated with malignancies, meig's syndrome, head trauma, and ascites associated with malignancies, meig's syndrome, clusion, may also be treated. Monoclonal antibodies are generated in thybridoma cells and those with affinity for VEGF are identified by immunoprecipitation or by an in vitro binding assay

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to humanised anti-VEGF (vascular endothelial growth factor) antibodies or a variant of a parent anti-VEGF antibody, which binds human VEGF. The anti-VEGF antibodies are useful for inhibiting VEGF-induced angiogenesis in a mammal (particularly a human), particularly those having a tumour a retinal disorder e.g. intraocular neovascular disorders. The present sequence is an exemplary heavy chain variable domain of the humanised anti-VEGF antibody of the invention
                                                                                                                                                                                                                  Cytostatic; ophthalmological; humanised; antibody; anti-VEGF; VEGF; vascular endothelial growth factor; angiogenesis inhibitor; tumour; retinal disorder; intraocular neovascular disorder; Y0313-1; heavy chain; variable domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New humanized anti-VEGF (vascular endothelial growth factor) antibodies or their variants, useful for inhibiting VEGF-induced angiogenesis in a mammal, particularly for treating tumor or retinal disorders.

Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework region in a host cell.

Claim 13; SEQ ID NO 19; 161pp; English.

The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antibody or antigen binding fragment comprising a modified framework region (FR) in a host cell, and recovering the antibody or antigen binding fragment variable domain comprising the modified framework from the host cell. The modified FR in the method described above has a substitution of at least one amino acid

cc the amino acid found at the corresponding FR position of a human subgroup variable domain consensus sequence that has a hypervatable region 1 (HVR1) and/or HVR2 amino acid sequence with the most sequence identity (HVR1) and/or HVR2 amino acid sequence with the most sequence identity with a corresponding HVR1 and/or HVR2 sequence of the variable domain.

CC The antibody or antigen binding fragment variable domain comprises the modified antibody or antigen-binding fragment. The antibody and antigen binding fragment to antibody and antigen binding fragment or antibody and antigen binding fragment in antibody and antigen binding fragment and antibody and antigen binding fragment invention are useful for methods and compositions of the present invention are useful for producing antibodies or antigen binding fragments in cell culture, in the particular for improving the yield of recombinant antibodies or antigen binding fragments in cell culture. The antibodies of the invention can be used to diagnose, treat, inhibit or prevent e.g. tumours and composition and immunological disorders. The present sequence represents a heavy chain HVR1 peptide of an anti-VEGF (vascular cendothallal cell growth factor) antibody, which is used in the centure. ö Improving affinity of polypeptides, particularly anti-IgB antibodies - by identifying aspartyl residues which undergo isomerisation and substituting alternative residues and screening for affinity against the Variable heavy chain; IgB; antibody; anti-IgB; reduction; prevention; histenmine; production; hypersensitivity; allergen; anaphylaxis; atopic allergy; asthma; allergic thinitis; conjunctivitis; hay fever; eczema; anaphylactic shock; urticaria. The sequence is that of the variable heavy chain of e27. It was used as part of a method to improve the affinity of anti-IgE antibodies such as e26 and e27. The e26 and e27 antibodies can be used for reducing or preventing IgE mediated production of histamine in a mammal. They can be

This invention relates to a nucleotide sequence encoding an antibody with improved anti-IgB antibody activity. The antibody has improved action due to a process comprising, a) identifying aspartyl residues prone to isomerisation in unimproved anti-IgB (immunoglobulin B) antibody; b) substituting alternative residues to create candidate molecules, and c) substituting alternative residues to create candidate molecules, and c) carget molecule. Use of the antibody results in antiasthmatic; antiallergic; ophthalmological; dermatological and antiinflammatory activity. The antibodies are useful for treating IgB-mediated disorders such as asthma, allergic rhinitis, conjunctivitis, eczema, urticaria and food allergies. The mutant antibodies produced by the above mentioned concletc acids may also be used as affinity purification agents and in diagnostic assays for detecting the expression of an antigen of interest in specific cell, tissues or serum. Anno acid sequences AAB76936.

AAB7660 represent fragments of anti-IgB antibodies of the invention. Polymucleotide sequence AAF69253 represents an expression plasmid used in the generation of affinity improved anti-IgB antibodies
                                                                                                                                                                                                                                                                                                                                                                    Antibody; antiaethmatic; antiallergic; ophthalmological; dermatological; antinflammatory; Ig B; immunoglobulin B; asthma; allergic rhinitis; conjunctivitis; eczema; urticaria; food allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding anti-immunoglobulin B antibody with improved properties, produced by substituting aspartyl residues in unimproved immunoglobulin B prone to isomerization by other residues by affinity
                                                                                                                                                                                                                                                                                                   Variable heavy chain sequence of e25, e26 and e426 SEQ ID 12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 64; DB 4; Length 114; 100.0%; Pred. This invention relates to a nucleotide sequence encoding an antibody with improved anti-IgB antibody activity. The antibody has improved action due comprising, a) identifying aspartyl residues prone to isomerisation in unimproved anti-IgB (immunoglobulin B) antibody; b) substituting alternative residues to create candidate molecules, and c) substituting alternative residues which display affinity against the carget molecule. Use of the antibody results in antiasthmatic; antiallargic; ophthalmological; dermatological and antiinflammatory activity. The antibodies are useful for treating IgF-mediated disorders cativity. The antibodies are useful for treating IgF-mediated disorders such as asthma, allergic rhinitis, conjunctivitis, eczema, urticaria and food allergies. The mutant antibodies produced by the above mentioned nucleic acids may also be used as affinity purification agents and in diagnostic assays for detecting the expression of an antigen of interest in specific cell, tissues or serum. Amino acid sequences AAB76936.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polynucleotide sequence AAF69253 represents an expression plasmid used in the course of the invention, and oligonucleotides AAF69254 - AAF69271 are used in the generation of affinity improved anti-1g8 antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti-IgE antibody e25, e26 and e426 variable heavy chain domain (VH).

                                                                                                                                                                                                                                                                                                                                                                                                            New composition of an improved anti-IgE antibody or IgE binding fragment, useful for treating IgE-mediated diseases, e.g. atopic allergy, asthma, conjunctivitis, eczema, urticaria or food allergies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to therapeutic compositions comprising anti-IgB antibody or IgB binding fragment in combination with an adjunct immunosuppressive agent. The composition is useful for treating IgB-mediated disorders. The disorders include atopic allergy associated with anaphylactic hypersensitivity and asthma, allergic rhinitis and conjunctivitis, eczema, urticaria and food allergies. The present sequence is an anti-IgB antibody variable heavy chain domain (VH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               51. 66

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New composition of an improved anti-1gB antibody or IgB binding fragment, useful for treating IgB-mediated diseases, e.g. atopic allergy, asthma, conjunctivitis, eczema, urticaria or food allergies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to therapeutic compositions comprising anti-IgE antibody or IgE binding fragment in combination with an adjunct immunosuppressive agent. The composition is useful for treating IgE-mediated disorders. The disorders include atopic allergy associated with anaphylactic hypersensitivity and asthma, allergic rhinitis and conjunctivitis, eczema, urticaria and food allergies. The present sequence is an anti-IgE antibody variable heavy chain domain (VH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for treating an IgB-mediated disorder. The method involves administering a therapeutical amount of an anti-IgB antibody or its IgB binding fragment. The invention is useful for treating an IgB-mediated disorder e.g. asthma, allergic rhinlis, eczema, utticaria, food allergies and hypersensitivity e.g. anaphylactic hypersensitivity. The present sequence is the human anti-IgB antibody e26, e27 and e426 variable heavy chain protein.
                                                                                                                                                                                                                                            Treating an IgB-mediated disorder, e.g. asthma, allergic rhinitis, eczema, urticaria, food allergies, or hypersensitivity, by administering an anti-IgB antibody or its antigen-binding fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 64; DB 9; Length 114; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chemotherapy, IgB-mediated disorder, asthma, allergic rhinitis, eczema, urticaria, food allergy, hypersensitivity, anaphylactic hypersensitivity; antiasthmatic; antiallergic, dermatological, antibacterial; immune disorder; inflammation; ear disease, nose disease; throat disease; respiratory disease; antimflammatory; dermatological disease; immunosuppressive; antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for treating an IgB-mediated disorder. The method involves administering a therapeutical amount of an anti-IgB antibody or its IgB binding fragment. The invention is useful for treating an IgB-mediated disorder e.g. asthma, allergic rhinitis, eczema, urticaria, food allergies and hypersensitivity e.g. anaphylactic hypersensitivity. The present sequence is the human anti-IgB antibody e27 heavy chain variable region protein.
                                                                                                                                                                                                                                                                                                                                                               Treating an IgB-mediated disorder, e.g. asthma, allergic rhinitis, eczema, urticaria, food allergies, or hypersensitivity, by administering an anti-IgB antibody or its antigen-binding fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human anti-IgB antibody e26, e27 and e426 variable heavy chain protein.

The present invention relates to compositions comprising a carrier, a first active agent comprising non-glucocorticoid servoids or their salts and a second active agent comprising an anti-immunoglobulin B (1gB) antibody effective to treat asthma, chronic obstructive pulmonary disease.

The compositions are also useful for ceducing the probability of or treating asthma and chronic obstructive pulmonary disease. The compositions are also useful for treating respiratory, lung/malignant disorder/condition such as asthma, chronic obstructive pulmonary disease, cystic fibrosis, dyspae, emphysema, chronic obstructive pulmonary hypertension, pulmonary fibrosis, hyper-responsive airways, increased adenosine or adenosine receptor levels, adenosine airways, increased adenosine or alengises, lung surfactant or usigninone depletion, chronic bronchitis, bronchoconstriction, difficult cuspiratory tract inflammation or allergies, lung surfactant or uniquinone depletion, chronic bronchitis, bronchoconstriction, difficult function, pulmonary vasoconstriction, impeded respiratory distress syndrome, administration of adenosine est for cardiac respiratory distress syndrome, administration of adenosine creation of adenosine creation of adenosine creation of adenosine or chronic bronchitis, and for reducing levels of sensitivity to adenosine or adenosine administration of adenosine pain, allergic rhinitis, cancer or chronic bronchitis, and for reducing levels of sensitivity to adenosine or adenosine creeptors. The present sequence is a humanized anti-IgB antibody CDR domain, used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antiasthmatic; Respiratory-Gen.; CNS-Gen.; Hypotensive; Antiinflammatory; Antimicrobial; Antiallergic; Cardiant; Analgesic; Vasotropic; asthma; chronic obstructive pulmonary disease; respiratory disease; pulmonary disease; respiratory disease; pulmonary disease; cystic fibrosis; dyspnea; emphysema; pulmonary pypertension; pulmonary fibrosis; hypotrasponsiveness of the airways; infectious diseases; respiratory tract inflammation; chronic bronchitis; respiratory distress syndrome; pain; allergic rhinitis; cancer; immunoglobulin E; IgE; antibody; antibody therapy.
              Composition used for treating e.g. asthma, chronic obstructive pulmonary disease, cystic fibrosis, dyspnea, emphysema, pain, allergic rhinitis and cancer, comprises carrier, non-glucocorticoid steroids and anti-

The present invention relates to compositions comprising a carrier, a first active agent comprising non-glucocorticoid steroids or their salts and a second active agent comprising an anti-immunoglobulin B (IgE) antibody effective to treat asthma, chronic obstructive pulmonary disease.

Cor a respiratory or lung disease. The compositions are useful for crediting the probability of or treating asthma and chronic obstructive pulmonary disease. The compositions are also useful for treating respiratory, lung/malignant disorder/condition such as asthma, chronic obstructive pulmonary hypertension, pulmonary fibrosis, dyspaes, emphysema, chronic obstructive pulmonary hypertension, pulmonary bronchoconstriction, respiratory tract inflammation or allergies, lung surfactant or usiquinons depletion, chronic bronchitis, bronchoconstriction, difficult cusquinons depletion, chronic bronchitis, adenosine est for cardiac function, pulmonary vasoconstriction, impeded respiration, acute respiratory distress syndrome, pain, allergies crimitis, cancer or chronic bronchitis, and for reducing levels of sensitivity to adenosine or adenosine or adenosine or allergies antining antining contining and the present sequence of succerving the present sequence of succerving the present sequence is a humanized anti-IgB antibody CDR domain, used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                  Composition used for treating e.g. asthma, chronic obstructive pulmonary disease, cystic fibrosis, dyspnea, emphysema, pain, allergic rhinitis and cancer, comprises carrier, non-glucocorticoid steroids and antimmunoglobulin E antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mouse monoclonal antibody; murine; surface antigen preSl epitope; hepatitis B virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The sequence is that of the variable heavy chain of MaEil. It was used as part of a method to improve the affinity of anti-IgE antibodies such as e26 and e27. The e26 and e27 antibodies can be used for reducing or preventing IgE mediated production of histamine in a mammal. They can be used for treating a disorder mediated by IgE such as hypersensitivity, atopic allergy, asthma, allergic rhinitis, conjunctivitis, hay fever, eczema, anaphylactic shock and urticaria. The antibodies can also be used for affinity purification, detection and diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Improving affinity of polypeptides, particularly anti-1gB antibodies - by identifying aspartyl residues which undergo isomerisation and substituting alternative residues and screening for affinity against the
                                                                                                                                       The invention relates to a changeable region of mouse monoclonal antibod recognising surface antigen preSI epitope of hepatitis B virus and gene. This sequence relates to a protein encoded by a 357nt DNA of the

The sequence is that of the variable heavy chain of F(ab)-2. It was used as part of a method to improve the affinity of anti-1gB antibodies such as e26 and e27. The e26 and e27 antibodies can be used for reducing or preventing IgB mediated production of histamine in a mammal. They can be used for treating a disorder mediated by IgB such as hypersensitivity, atopic allergy, asthma, allergy chinitis, conjunctivitis, hay fever, eczema, anaphylactic shock and urticaria. The antibodies can also be used for affinity purification, detection and diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Improving affinity of polypeptides, particularly anti-IgB antibodies - by identifying aspartyl residues which undergo isomerisation and substituting alternative residues and screening for affinity against the

                                                                                                                                                                                                                                                                 ö
                                                                                                                             antibody
```

```
This invention relates to a nucleotide sequence encoding an antibody with improved anti-1gB antibody activity. The antibody has improved action due to a process comprising, a) identifying aspartyl residues prone to somerisation in unimproved anti-1gB (immunoglobulin B) antibody; b) substituting alternative residues to create candidate molecules, and c) selecting those candidate molecules which display affinity against the target molecule. Use of the antibody results in antiasthmatic; antiallergic; ophthalmological; dermatological and antiinflammatory cativity. The antibodies are useful for treating IgE-mediated disorders such as asthma, allergic rhinitis, conjunctivitis, eczema, urticaria and food allergies. The mutant antibodies produced by the above mentioned nucleic acids may also be used as affinity purification agents and in diagnostic acids may also be used as affinity purification agents and in clasmostic acids may also be used as affinity purification agents and in clasmostic cell, tissues or serum. Amino acid sequences AAB76936-
ABA7690 represent fragments of anti-1gE antibodies of the invention.
Polynucleotide sequence AAF6923 represents an expression plasmid used in the generation of affinity improved anti-1gE antibodies
                                                                                                Antibody; antiasthmatic; antiallergic; ophthalmological; dermatological; antiinflammatory; Ig E; immunoglobulin E; asthma; allergic rhinitis; conjunctivitis; eczema; urticaria; food allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding anti-immunoglobulin E antibody with improved properties, produced by substituting aspartyl residues in unimproved immunoglobulin E prone to isomerization by other residues by affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 64; DB 4; Length 121; 100.0%; Pred.
